

Expanding and enhancing digital services for residents

Município de Vila do Bispo

Across Portugal, many public services are being devolved to municipal governments. To help underpin the new services, Município de Vila do Bispo aimed to boost the performance and scalability of its e-government infrastructure.

Customer Problem

To deliver new e-government services to residents across the Faro district, Município de Vila do Bispo looked to refresh its data center infrastructure.

Lenovo Solution

The organization selected Lenovo ThinkSystem SR650 servers connected to low-latency Lenovo ThinkSystem DE4000H storage, creating headroom for future digital innovation.

Business Impact

Município de Vila do Bispo can now add new e-government services with ease, while boosting application performance for employees and slashing backup windows.

“We used Lenovo infrastructure solutions successfully for more than ten years prior to this project, and in all that time the platform never let us down. For that reason, refreshing our environment with Lenovo was the clear choice.”
